Case Study

Smart Passenger Information Systems Keep Travelers Updated

Complex, But Not Impossible

History shows that passengers want to be kept abreast of the latest information concerning their travel, regardless of the means of transportation. The multimedia information should be informative and can also be entertaining.

In a transportation hub, the difficulty in providing that wealth of information grows exponentially. This is based on the size of the hub and the number of buses, trains, and other means of transportation that must be monitored and the number of connected subsystems that will be deployed throughout the terminal.

Check out this case study to understand how Litemax' multi-display Smart Onboard Passenger Information treats riders as first priority and brings excellent customers experience by solving the technology limits.
